Read Your Water Bill

This is an example of a Prescott water bill. Your water bill may appear different, but the same information is there. The calculation example demonstrates how to determine how much water each person in the home uses per day: gallons per citizen-day, or gpcd – an excellent method of tracking your progress. You could pencil this simple calculation on every water bill, or the C2E "Dashboard" program will calculate it.

Look at the history graph. Compare your use this month with last year. Note that April thru October typically demand higher water use. This increase represents your outdoor water use, which should be replaced with rainwater harvesting. Try to eyeball a horizontal line on the graph that only considers the gallons used for November – March. This represents your average winter water use; we assume this represents indoor water usage every month of the year, which can be reduced by indoor conservation.
